The Susquehanna River Basin Commission was created as an independent agency by a Federal-Interstate Compact* among the States of Maryland, New York, Commonwealth of Pennsylvania and the Federal Government. In creating the Commission, the Congress and State Legislatures formally recognized the water resources of the Susquehanna River basin as a regional asset vested with local, State and National interests for which all the parties share responsibility. As the single Federal-Interstate water resources agency with basinwide authority, the Commission's goal is to effect coordinated planning, conservation, management, utilization, development and control of basin water resources among the government and private sectors.

I. PURPOSE AND SCOPE

In order to effectively manage the resources of the Chesapeake Bay as well as the implementation of pollution controls in the Chesapeake Bay drainage basin, the Susquehanna River Basin Commission (SRBC) has placed historical water quality data and corresponding project documentation into the EPA's Chesapeake Bay Data Base. The data collected and stored have been generated from special studies, general surveys, and monitoring networks in the lower Susquehanna River Basin. These data will be useful in monitoring baseline trends within the lower Susquehanna River Basin.

II. METHOD OF INVESTIGATION

A. Data Sources

An inventory of organizations involved in data collection was compiled for possible sources of data generated from studies involving water quality. These organizations include federal and state agencies, colleges and universities, power companies, consulting firms, and other private organizations. Organizations contacted for data are listed in Table 1. The majority of water quality data were documented from projects completed by the U. S. Geological Survey, Pennsylvania Department of Environmental Resources, and the SRBC.

Online computer searches were utilized to generate lists of publications and reports completed on water quality studies in the Susquehanna River Basin. These lists were then reviewed and the reports located to determine the ones pertinent to the pur-

pose and scope of this project. The two systems utilized were the Library Information Access System (LIAS) at the Pennsylvania State University and the DIALOG system, a commercial network of bibliographic data bases available at the Pennsylvania State Library in Harrisburg, Pennsylvania.

B. Data Set Documentation & Data Files

A data sheet was prepared and the format approved by the Chesapeake Bay Program's Senior Science Specialist, Bess Gillelan, Computer Sciences Corporation (Table 2). These data sheets provided the means to organize information from water quality reports and publications before entry on a computer system. The two types of information included on the sheets were the data set documentation and the actual data file.

The data set documentation consisted of descriptive information about its associated data file. This information included project background, station locations, and parameter descriptions. Also, lists of water quality network stations and stream investigations are included in separate documented reports.

The project background includes information on the title of the study and the agency and/or persons responsible for the contents. Addresses are provided if anyone needs to contact the agency for information on the data or questions on the methodologies.

In many reports, the stream stations used in a particular study were not defined by a geographic coordinate system (i.e.,

TABLE 2
DATA DOCUMENTATION SHEET FORMAT

*TI: Title of report.
*DS: Name of attached data set if data was not already in STORET.
*RR: Associated data sets if data was not already in STORET.
*PI: Principle investigating agency.
*PO: Address of agency.
*PR: Authors of report or project officer.
*PE: Period of project record.
*GE: Geographic names of study area.
*GL: Defined area by maximum and minimum latitude and longitude.
*AB: Abstract of study.
*ST: Station ID, latitude, longitude, river mile, description.
*PA: Parameter, units, CAS code, label.
SAS data set if data was not located in STORET.

latitude and longitude) or a stream mile index. Even after contacting some project leaders, they could not provide geographic coordinate location of the site. Therefore, many station locations are indexed only by descriptive site information in the data set documentation.

A list of parameters complied from all documented reports appears in Appendix A. This list includes the coded label of the parameter, its associated CAS code, and a brief description of the parameter. Several different labels may appear for the same parameter depending on how the parameter was referenced in each documented report.

After the data set documentation was completed, the associated data set file was attached to the documentation as a SAS data set. Paper-based data files were collected, formatted, and keypunched for storage on the SRBC computer system. Computerized data that existed for each data set on systems other than the EPA's STORET system were retrieved and reformatted for storage on the SRBC computer system. Data that already existed on STORET were not retrieved but noted in the data set documentation.

Once the data set documentation and data set file were entered on the SRBC computer system, the data set was visually checked for errors and corrected. The finalized form was then transferred to magnetic tape and transmitted to the Chesapeake Bay Data Base.

C. Data Quality

The key objectives of a project QA plan are to document sampling methods and laboratory procedures for data being generated for various water quality parameters. The QA plan also ensures data comparability over different points in time by standardizing sampling and lab procedures. Knowing the quality of the data in each documented report is important in some applications where data may need to be of the highest quality. In other instances, data of lower quality may be acceptable.

Presently, agencies participating in EPA funded water quality projects are required to submit individual QA plans. QA plans for recent EPA funded projects that were documented in this report appear in Appendix B. QA plans from individual agencies were not required for projects in the past. For projects completed by government agencies, the procedures utilized are outlined at the particular lab processing water samples for each project. For example, the analytical methods completed for water samples at the PADER lab in Harrisburg are outlined in the Quality Assurance/Work Plan for the PADER Bureau of Laboratories. When possible, laboratories processing samples were noted in each documented report under the abstract of the report documentation.

Because of technological advances in water quality monitoring, laboratory procedures for measuring certain water quality parameters may have changed thus establishing new critical limits for those parameters. In many instances these limits are not known or available for historical data. This case was true for many studies completed by non-governmental agencies

and also studies completed several years ago. However, information on the establishment of new critical limits for water quality parameters may be obtainable from the particular lab processing samples. The assumption is made that the use of a ">" or "<" symbol in the actual data constitutes the critical limit for that parameter in the documented report.

III. CONCLUSIONS

An investigation of historical data generated from studies in the lower Susquehanna River Basin was conducted by the SRBC. The purpose of this investigation was to obtain historical surface water quality data and transfer the information to the Chesapeake Bay Data Base. These data would then be useful in establishing baseline trends in the Susquehanna River.

The generation of water quality data from studies related to historical nutrient loadings in tributaries to the lower Susquehanna River didn't really begin until after the early 1970's with only a very few stations containing long term records on particular parameters. Most water quality monitoring activities were directed at point sources of pollution. Recently, water quality monitoring studies have been focusing more on nonpoint sources of pollution. Only within the past few years has there been an increase in the number of projects investigating the effects of rural land use practices upon surface water quality within the lower Susquehanna River Basin. Some studies conducted by various governmental agencies are still continuing.

Most of the major studies that resulted in a significant period of record are documented in this report. Studies and surveys that generated data for only a one time sample analysis were not included except for a list of stream investigations completed by the Pennsylvania Department of Environmental Resources. Other historical data may be located in sewage treatment plant records, public water supply records, and theses completed by individuals at various colleges and universities. This report is not an all inclusive source of information for water quality studies completed in the lower Susquehanna River Basin, but is intended as a general directory for those interested in management of and research on the environment and water resources of the lower Susquehanna River Basin and its relationships to the water quality problems of the Chesapeake Bay.

A list of documented reports and data submitted to the Chesapeake Bay Data Base is located in Appendix D. Also included is a selected bibliography for which a filename follows each documented reference in Appendix C.

1. Project Name: Assessment of Nutrient Sources from Main Stem and Selected Watersheds in the Susquehanna River Basin

2. Project Requested By: U.S. EPA

3. Date of Request: April 1984

4. Date of Project Initiation: October 1984

5. Project Officer: Jerrald R. Hollowell

6. Quality Assurance Officer: Arthur Ott

7. Project Description:

A. Objective and Scope Statement

A five-year study was designed to provide: (1) nutrient loading data for the Main Stem Susquehanna River and its major tributaries in the Central and Lower Basin, and (2) nutrient runoff from selected small watersheds representative of each of the prevalent land uses found in the Central and Lower Basin. Nutrient loadings will be documented on a seasonal and individual storm basis. Figure 1 shows the general locations of the sampling sites in the study area.

B. Data Usage

The environmental measurements and analysis will provide baseline nutrient loading data for Main Stem, major tributaries and other representative subwatersheds in sufficient detail to:

1. Allow model refinement.
2. Allow model verification.
3. Establish a sound data base for government, agriculture, industry and the public to most

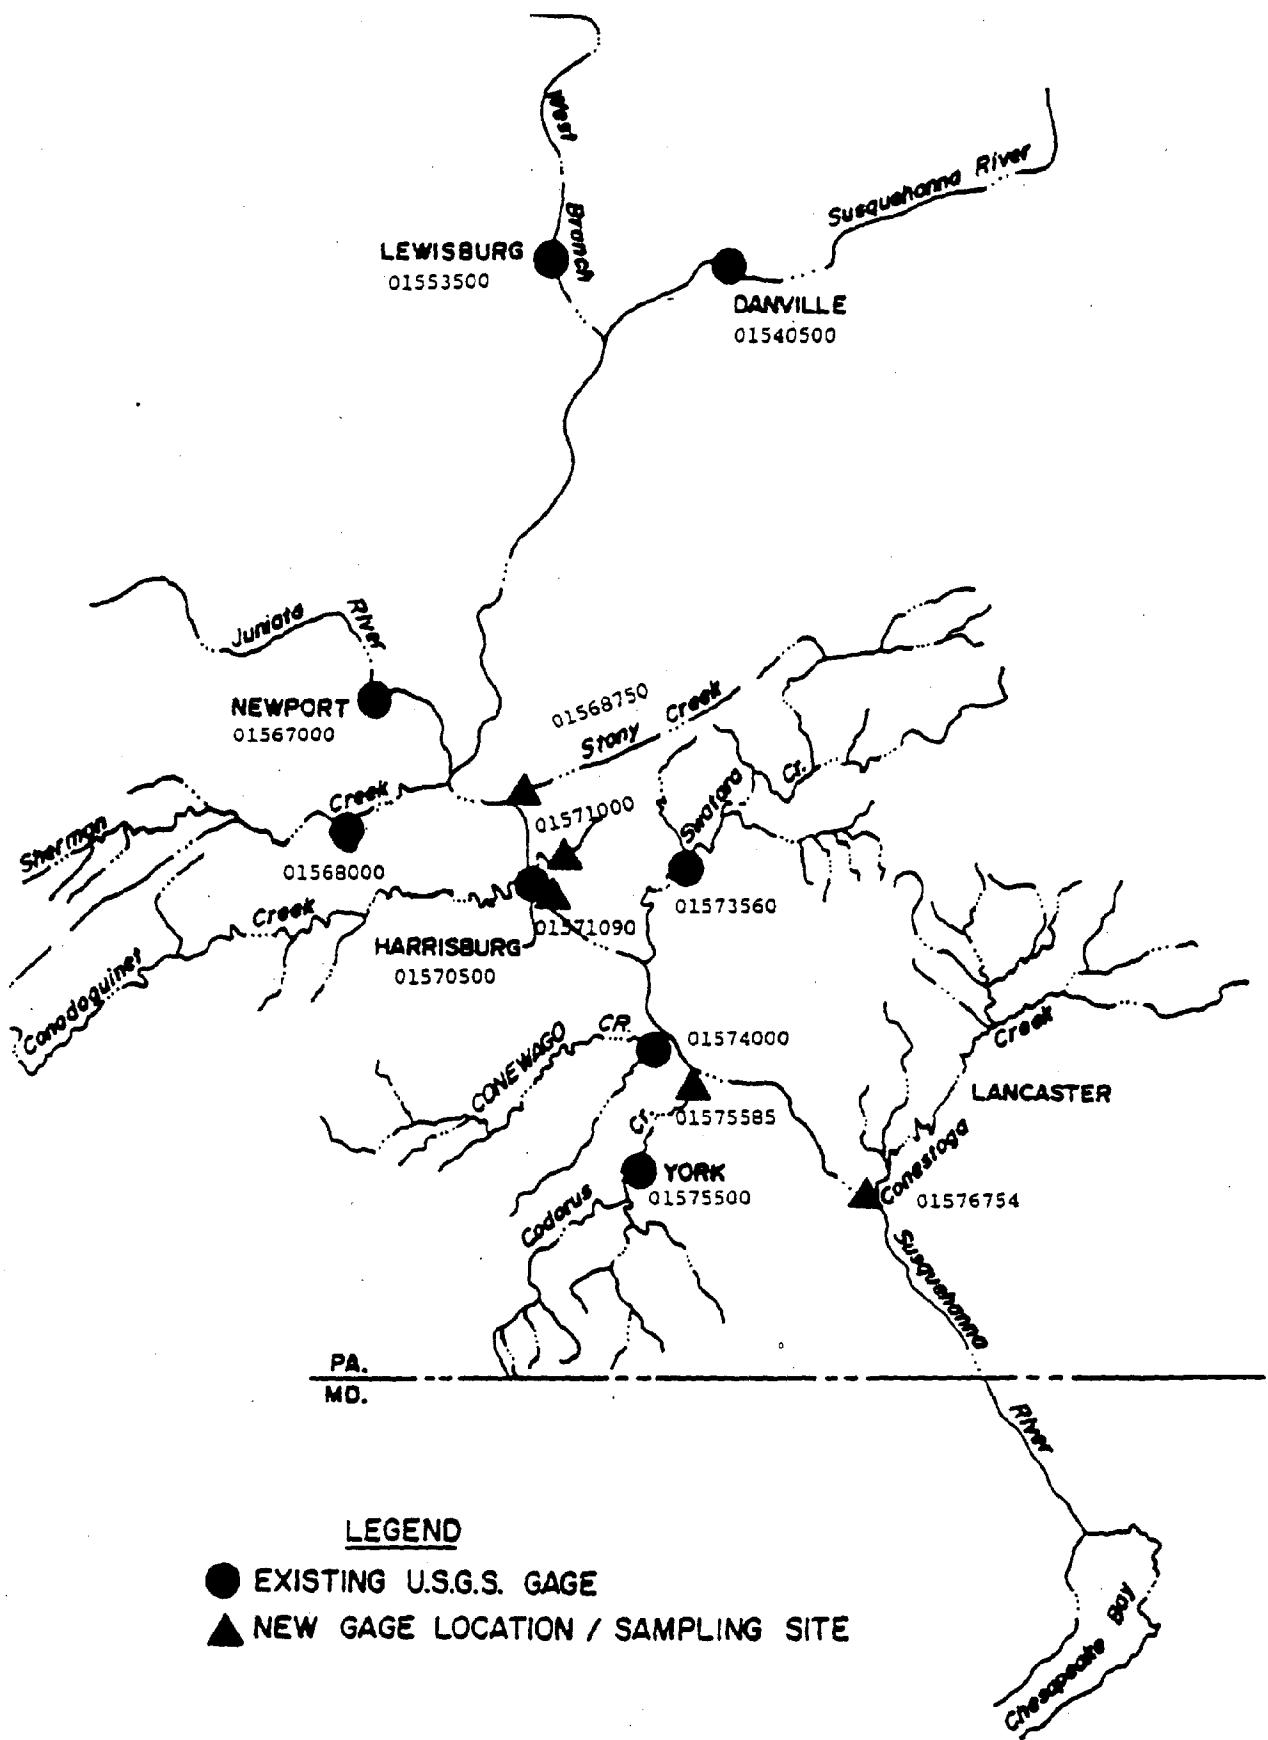

FIGURE 1. General Locations of Sampling Stations
in the Study Area

effectively plan and implement immediate and long-range nutrient reduction efforts.

C. Monitoring Network Design and Rationale

This section provides the rationale for establishing the sampling network which includes a series of Main Stem and major tributary sites and a series of sites located on subwatersheds that support significant areas of specific land use or representative combinations of land uses.

Series 1

The collection of nutrient data above the fall line at stations on the Main Stem and large tributaries is deemed necessary to enable accurate allocation of loadings to main river reaches and to major subbasins (see Figure 1). Sound base line nutrient data for the Susquehanna River at Harrisburg (01570500) and Danville (01540500), the West Branch at Lewisburg (01553500), the Juniata at Newport (01567000), and at appropriate stations on Conestoga River (01576754), Swatara Creek (01573560), and Conewago Creek (01574000) will confirm existing Bay model loading allocations and provide the basis for refining the model output for these areas. Each site represents large areas having significant differences and levels of complexity in terms of geological setting and current land uses.

In most cases the sites include stations that have been sampled consistently for one purpose or another over a

period of years and where flow measurements are available or facilities for such measurements can be readily installed.

Series 2

These stations are located on relatively small watersheds of varying geologic setting. They provide a range of specific land uses or representative combinations of land uses. The sites were chosen to represent: 1) a total wilderness area, 2) a sparsely populated forest/cropland watershed with no areas of concentrated residential development, 3) a small watershed of intense suburban development throughout its headwaters with urban/industrial development surrounding its lower reaches, and 4) a complex area that drains extensive cropland, suburban and urban development and includes a number of fairly large reservoirs throughout the watershed.

These four watersheds are considered to be representative of many areas throughout the basin and will provide detailed information for: 1) refining the Bay NPS model, 2) identifying problems related to specific land uses and combinations of land uses, and 3) future management actions in these areas. The watersheds selected are:

1. Paxton Creek: a 27-square mile watershed draining greater Harrisburg area. One monitoring site will be established at an existing USGS gage (01571000) near Rt. 81 and Progress Avenue and will monitor runoff

from a highly developed suburban area of about 11.2 square miles. Another monitoring site (01571090) will be established near the mouth and will include runoff from an urban and light industrial area.

2. Stony Creek: a 35-square mile watershed draining a pristine, entirely forested valley. The only development is a secondary road crossing the extreme upper end of the watershed and some abandoned coal mine workings of limited extent. A monitoring site (01568750) will be established at the lower limit of the forested area (21.9 sq.mi.) approximately nine miles upstream of the mouth.
3. Sherman Creek: a 244-square mile watershed draining a lightly developed valley of mixed forest and agriculture uses typical of the central Susquehanna River Basin, Valley and Ridge Province Watersheds. A monitoring site (01568000) will be established at Shermansdale at an existing USGS gage. At this point, Sherman Creek drains 200 square miles.
4. Codorus Creek: a 278-square mile watershed draining a mixed urban, suburban, forested, and agriculture use area, typical of the lower basin watersheds. A monitoring station will be established at the USGS gage (01575500) upstream of York which will sample a predominately agricultural--lightly developed and forested area. Another monitoring station (01575585) will be established just upstream of the

Springettsbury Township STP. This station will monitor an urban environment.

The stream monitoring stations have been established. Gage houses have been erected, where necessary to house continuous stage recording instruments and automatic streamflow sampling equipment. Stage recorders have been installed at all stations and discharge measurements have been initiated at each new gaging station in order to develop a stage-discharge relationship. Table 1 lists those sites to be hand-sampled from bridges and those to be sampled using battery-operated automatic sampling equipment. Additional station descriptions are provided in Attachment A.

Starting October 1, 1984 and continuing for five years, samples from baseflow and selected storms will be collected at all stations described above and appearing on Table 1. Samples will be collected at six verticals across the section and composited using the equal-width sampling procedure. All samples will be depth-integrated using USGS standard equipment and techniques. Baseflow samples will be collected manually once a month at all stations.

Storm runoff samples will be collected during five selected storms to document seasonal runoff and a major runoff event following spring planting in the agricultural watersheds. Field personnel will be dispatched to collect a baseflow sample prior

TABLE 1

<u>Sampling Site</u>	<u>Exist. Gage</u>	<u>Drainage Area @ Gage</u>	<u>@ Mouth</u>	<u>USGS Data</u>	<u>New Gage</u>	<u>Auto. Sampler</u>

d = discharge, c = chemical, b = biological, t = temperature,
 s = suspended sediment

to the onset of selected storms. These individuals will then collect samples periodically to document the quality of the rising and falling stream stage. Six discreet samples over the hydrograph (three on the rising and three on the fallling stage) will be sent to the laboratory for analysis. Field personnel will periodically collect samples manually in conjunction with the automatic samplers to check the representativeness of the samples collected automatically (minimum of two storms per year).

D. Monitoring Parameters and Their Frequency of Collection

During the first year of the project, all samples will be analyzed for the following physical characteristics and constituents:

pH

Temperature

Specific Conductance

Suspended Sediment

Organic Carbon, total

Nitrite - N and Nitrate - N, total

Ammonia - N, total and dissolved

Organic N + NH₄, total and dissolved

Phosphorus, total and dissolved

Orthophosphate, dissolved

In subsequent years, half of the storm samples will be analyzed only for physical characteristics and total concentrations.

Baseflow samples will be collected once a month and storm runoff samples will be collected during five selected storms per year.

E. Parameter Table

Parameter	No. of Samples/yr	Sample Matrix	Analytical Method Ref.	Sample Preservation*	Holding Time*
			USGS**		
Total Organic N+NH ₄ -N	545	water/sed	I-4552-78	4°C + HgCl ₂	+ 16 days
Dissolved Organic N+NH ₄ -N		water	I-2552-78

8. Project Fiscal Information (optional)

See EPA grant application.

9. Schedule of Tasks and Products

10. Project Organization and Responsibility

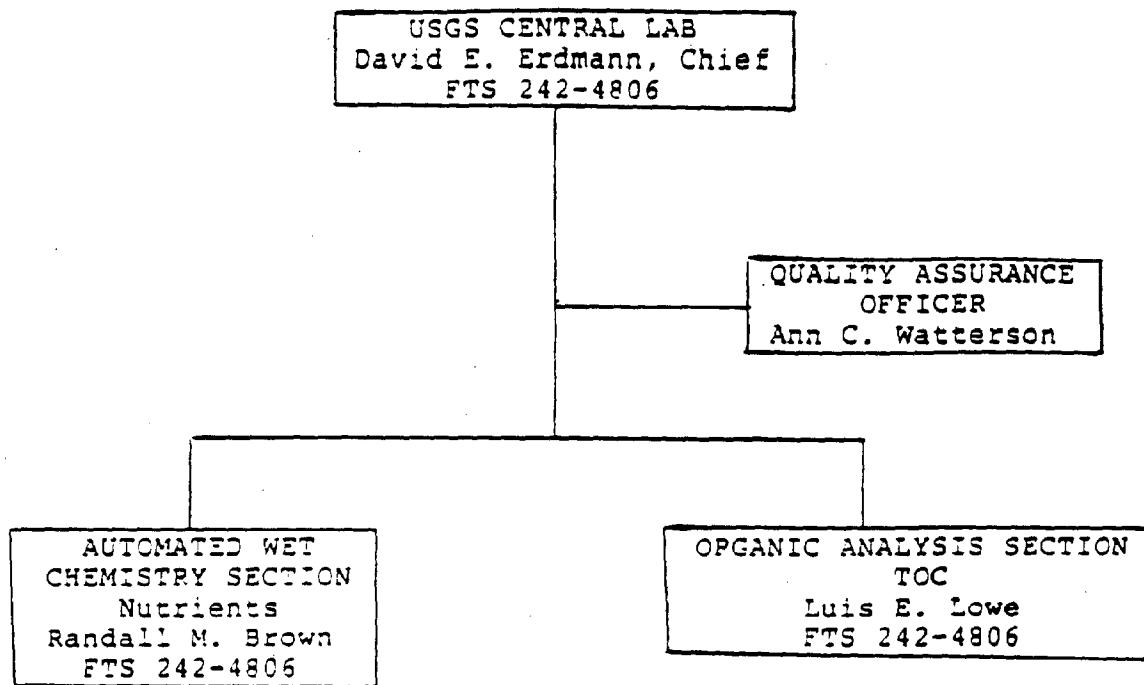

a. Project Organization

Due to the routine nature of the project, it is not essential to require lab personnel to review the combined work/QA project plan before monitoring is initiated.

10. Project Organization and Responsibility

b. USGS Central Lab

Due to the routine nature of the project, it is not essential to require lab personnel to review the combined work/QA project plan before monitoring is initiated.

11. Data Quality Requirements and Assessments

DETECTION LIMITS AND QUALITY ASSURANCE OBJECTIVES

Parameter	Sample	Detection Limit mg/l	Accuracy	Precision	QA Protocol
Total Organic N + NH ₄ -N	all	0.1	*	*	2 EPA reference samples plus 1 standard per 15 samples
Dissolved Organic N+NH ₄ -N	all	0.1			Samples sent to the Lab for analyses
Total NH ₄ -N	all	0.01			will include 5% duplicate samples, 5% standard reference samples and 5% sample blanks
Dissolved NH ₄ -N	all	0.01			
Total NO ₂ +NO ₃ -N	all	0.1			
Total P	all	0.01			
Dissolved P	all	0.01			
Dissolved O'P	all	0.01			
TOC	all	0.1			

*See Attachment C

Field instrument and field operator techniques are checked twice a year for pH and specific conductance with USGS standard samples. Field pH and specific conductances are checked against lab values. Lab analyses are performed on the same day that the samples are received.

Field operators will check the pH and conductivity meters in the field against pH and specific conductance standards once in the morning prior to the start of sample collection and once in the afternoon. These checks will be made during each sample collection day. All standard values and meter readings will be recorded in the operating log accompanying the meters. The QA officer will periodically accompany field personnel to check on sampling and field chemistry procedures.

One duplicate sample, one standard reference sample and a sample blank will be submitted with each set of samples collected and sent to the laboratory for analyses. These results will be used to determine the precision and accuracy for the project samples.

Data Representativeness - Site Representation

Spatial variability inherent to a sampling site is addressed by taking depth-integrated, discharge-weighted water samples across the cross-sectional area at the sampling site and thus reflects the composite effect of whatever has occurred upstream from the site.

Data Comparability - Use of the USGS laboratory and field techniques, found in the National Handbook of Recommended Methods for Water-Data Acquisition, provides for a nationally and regionally uniform methodology for both field and laboratory analysis.

Data Completeness

Collection of greater than 90% of the total programmed samples will be deemed as fulfilling the project objectives. Sample collection at each site must provide adequate coverage so that seasonal variations in loading can be evaluated.

12. Sampling Procedures

A complete description of the sampling procedures used for this study can be found in "Methods for collection and analysis of water samples for dissolved minerals and gases." E. Brown, M.W. Skougstad, & M. Fishman: USGS---TWRI Book 5 Chapter A1,

1970; "Field methods for measurement of fluvial sediment." H.P. Guy and V. W. Norman: USGS---TWRI Book 3, Chapter C2, 1970; National Handbook of Recommended Methods for Water-Data Acquisition, Chapter 3 & 5.

The tracking of the sampling operations is shown in Table 2.

Description of sampling devices are found in National Handbook of Recommended Methods for Water-Data Acquisition, Chapter 3, pp 3-18 to 3-24.

Description of sampling containers, preservation techniques, and sample identification forms are found in the USGS Open-File Report 83-758, Water Quality Laboratory Services Catalog.

13. Sample Custody Procedures are not applicable to this study.

14. Calibration Procedures & Preventative Maintenance

Routine Calibration Instructions

Every instrument used to collect water quality data, or used to calibrate water quality monitors, will be checked for accuracy on a regular basis. Each instrument will have its own calibration sheets identified by W-number. These checks are required over and above those specified for field calibration in the "District Water Quality Field Handbook."

Batteries in all meters should be changed whenever needed, but at least yearly, preferably in the late fall.

A. Specific Conductance Meter

Record meter calibration at least weekly if in continuous use (or just before usage, if used infrequently) against three specific conductance standards, obtained within six months from the Central Laboratories.

Acceptance Criteria:

Standards (<1000 umhos/cm)	\pm 4%
(>1000 umhos/cm)	\pm 3%

B. pH Meter

Record meter calibration at least weekly if in continuous use (or just before usage, if used less frequently) against three pH buffer standards (4, 7, and 10), purchased within six months of its use. The pH meter is to be checked with at least two buffers at least prior to and just after each day's use. This check is to always be done and recorded in the instrument calibration log.

C. Thermometer

Check thermometers on an as needed basis or at least semi-annually against laboratory grade thermometers.

Acceptance Criteria:

Temperature	$+ 0.2^{\circ}\text{C}$
-------------	-------------------------

D. Maintenance of Calibration Records

1. Maintain records of instrument calibrations, repairs, and maintenance of each piece of equipment in the individual or "Water Quality Field Instrument Calibration Log."

2. Report any abuse or neglect of equipment or calibration schedules to the Project Chief.

E. Preventative Maintenance

1. Conductivity - dip cell

a. Wash with liquid detergent, 1% HCl, tap and distilled water.

b. Shake dry and store

2. pH - combination electrode

a. Store in electrode storage solution if to be used within 4-5 weeks.

b. For longer storage period, empty filling solution from electrode, rinse and store dry.

15. Documentation, Data Reduction & Reporting

All project data will be entered in the USGS WATSTORE (Water Data Storage and Retrieval) system. All data entered on "Central Laboratories Analytical Services Request Form" (Attachment D) plus the chemical analyses completed and verified by the Central Laboratory are transmitted and stored in the Water Quality File of WATSTORE.

Data products ranging from retrieval of data in tabular form to complex statistical analyses can be provided by the WATSTORE system.

Data stored in WATSTORE can also be obtained in machine-readable form for use on other computers or for use as input to user-written computer programs. Approved data is transferred to EPA/STORET on a monthly basis.

16. Data Validation

A. Review of Results from Laboratory Analyses

Computer trained personnel will retrieve results of analyses from the Central Laboratories weekly by executing the computer program LABPRIME and will submit copies of the analyses and "primary printouts" to the project personnel. Personnel will review results for accuracy and acceptability within 5-10 days after receipt using their analytical experience and knowledge of the water quality of streams in the basin and using methods prescribed in the following:

1. "Methods for Determination of Inorganic Substances in Water and Fluvial Sediments" (Skougstad and others, 1979).
2. "Standard Methods for the Examination of Water and Wastewater" (American Public Health Association and others, 1976).
3. "Study and Interpretation of the Chemical Characteristics of Natural Water" (Hem, 1970).

The LABPRIME program and the Water Quality File Edit System perform a number of consistency checks automatically (U.S. Geological Survey, 1975, Volume 3, Chapter VI A). These include but are not limited to the following:

1. Comparison of sum of cations with sum of anions (cation-anion balance).
2. Comparison of determined and calculated values for dissolved solids.

3. Comparison of specific conductance with sum of cations or anions.
4. Comparison of specific conductance with determined and calculated values for dissolved solids.
5. Comparison of values for dissolved constituents with values for total constituents.

Also available are a number of statistical and data-consistency checks which may be applied by use of SAS computer programs, which are readily available for use with USGS's WATSTORE Water-Quality File (SAS Institute Inc., 1979).

The project reviewer will investigate all LABPRIME and QW Edit consistency check remarks. If an error in an analysis is detected or suspected, the questionable value will be noted on the computer copy and a request for a rerun will be made to the USGS. Rerun data from the Central Laboratory are reviewed by the project personnel and appropriate changes made in the WATSTORE file. A copy of the approved analysis is transmitted to the project chief or cognizant personnel.

All water quality data obtained by the field service units and all results of analyses by the Central Laboratories for continuing stations will be stored in the appropriate WATSTORE computer file. The "primary printouts" obtained following entry of data in the appropriate WATSTORE computer file will be reviewed by the Laboratory Records Coordinator to insure that results of laboratory analyses are correctly entered into the computer file.

In addition to the above listed duties, the Laboratory Records Coordinator is responsible for the following:

1. Posting a sample log that includes this information:
 - a. Station identifier.
 - b. Date and time of sample collection.
 - c. Date samples shipped to lab.
 - d. Central Laboratory identification and record numbers.
 - e. Date analyses appeared on LABWEEK.
 - f. Date analytical sheet received.
2. Communication with Central Laboratory on any sample handling problems.
3. Maintaining an organized central filing system for all original water quality records which includes:
 - a. Field data sheets and notes.
 - b. Laboratory data sheets with notes.
 - c. Laboratory analytical sheets with notes.
 - d. Records from water quality monitors.

B. Review of Field Data

See "Acceptance Criteria", No. 14.

17. Performance and Systems Audit

A. Performance Audit

Independent sampling and laboratory analysis audits will be performed by USGS personnel sampling two of the thirteen sampling sites bi-monthly; and quarterly for four of the thirteen sampling sites.

B. System Audit

This audit is made as a qualitative and quantitative inspection and review of the total measurement system to determine whether the Data Quality Assurance (DQA) plan has been executed as specified and to evaluate the validity of data by independent checking by USGS.

The DQA plan for the measurement program should be the basis for conducting these audits. Audits include reviews of the following:

1. Organization and responsibility - Is the quality control organization operational? Are quality control and system audits properly made and documented?
2. Data collection - Are written data collection procedures available and followed? Are personnel completing all record forms and identification labels?
3. Sample collection - Are written sample collection procedures available and followed? Do the personnel use the required containers? Are containers cleaned to prevent contamination?
4. Sample analysis - Are written analysis procedures available and followed?
5. Human errors - Are data checks made and actions taken to control human errors? Is the program of pass-fail checks for operations in use? Does checking show that the desired quality assurance level is met?

6. Calibration - Are written calibration procedures available and followed? Are the records of past calibrations available; do they indicate that calibration corrections have been applied to the data?
7. Measurement comparisons - Are results from measurement comparison testing reviewed and used?
8. Preventive maintenance - Is the preventive maintenance schedule for the measurement program being followed?

Copies of reports on completed systems audits are sent to the program management for review, and to operators and supervisors for any necessary actions. Audit reports list:

1. Purpose of the audit.
2. Personnel involved in the audit.
3. Activities audited, the tests observed, the documents and data reviewed.
4. Observations of work performance and errors in procedures.
5. Recommendations for corrective action, changes in numbers of personnel, and changes in calibration on future work.
6. Deadline for completion of corrective actions.
7. Date chosen should minimize the effect of the discrepancies on future work.
8. Provide for verification of completion of corrective actions, either by written reports to the auditor, or by an additional visit to the operations site.

At the conclusion of the measurement program, a final audit should be made to verify that the program has met its objectives and was conducted in accordance with the DQA plan, and that all actions were adequately documented.

The role of audits in the overall measurement program is one of verification. While audits do not improve data quality if all work is correctly performed, they do provide assurance that the work prescribed for the measurement program has been conducted properly. Audits conducted by individuals not responsible for day-to-day operations provide another management control mechanism to program managers.

18. Corrective Action

Corrective action is practiced immediately upon discovery of a problem. USGS and SRBC project personnel constantly interact. Data and data collection activities are continually discussed and evaluated. Corrective action is taken immediately if the evaluation indicates action is necessary.

19. Reports

An interim report that characterizes nutrient discharges in the Lower Susquehanna River Basin will be prepared by March 1988.

The final report will include an assessment of nutrients discharged by the Susquehanna River to the Chesapeake Bay.

QUALITY ASSURANCE / WORK PLAN
WATER QUALITY MONITORING NETWORK OF INTERSTATE STREAMS
IN THE SUSQUEHANNA RIVER BASIN

- I. PROJECT NAME: Water Quality Monitoring Network of Interstate Streams in the Susquehanna River Basin.
- II. PROJECT OFFICER: Carl P. McMorran, Environmental Protection Specialist
- III. QUALITY ASSURANCE OFFICER: Jerrald R. Hollowell, Chief Division of Resource Quality, Management and Protection
- IV. DATE OF PROJECT INITIATION: April 1986
- V. PROJECT DESCRIPTION:

A. Objective and Scope. In Paragraph 803.4(b)(1) of the Regulations and Procedures for Review of Projects in the Susquehanna River Basin, the Susquehanna River Basin Commission (SRBC) staff is responsible for "reviewing projects that may result in a significant interstate effect on the water resources of the Basin." Staff has had difficulty meeting this responsibility due to a lack of current data from the interstate streams of the Basin. Although available data have generally been adequate for determinations concerning acute impacts, chronic and cumulative impacts are not readily discerned. A monitoring network on these interstate streams would greatly enhance the ability of SRBC staff to evaluate water quality impacts.

The data generated from such a network will also be useful for other water quality management plans. Sparse distribution of quantitative sampling locations is a major problem in determining the quality of the streams in the Susquehanna River Basin. Both the Pennsylvania Department of Environmental Resources (PaDER)

and the Maryland Department of Natural Resources (MdDNR) as well as other governmental agencies have expressed the need for more data to develop and enhance water quality management programs. These data are particularly critical for the management of water quality as it relates to the Chesapeake Bay.

B. Data usage. The proposed water quality monitoring network would consist of a series of surface water quality stations. These stations would be periodically sampled for biological and water quality conditions. The data will be reviewed to determine if interstate water quality standards are being compromised. The data will also contribute towards a staff ability to predict the probability that new discharge permit limitations or other factors will result in degraded water quality. The data will be treated statistically to differentiate seasonal fluctuations, long term trends and relationships between specific parameters and other factors.

In addition, the data will be entered into the EPA STORET database where it will be available to update 305(b) reports (water quality inventory) and 205(j) priorities (sewage construction grants), as well as for other uses. Appropriate data will also contribute to the Chesapeake Bay Monitoring Subcommittee reports.

C. Monitoring Network Design and Rationale. Streams which flow across state borders within the Basin are listed in Table 1. Data for project review purposes are most needed from the Susquehanna River between New York and Pennsylvania, and between Pennsylvania and Maryland; the Chemung River between New York and

Pennsylvania; the Tioga River between Pennsylvania and New York; Cayuta Creek between New York and Pennsylvania; and Deer Creek between Pennsylvania and Maryland.

The Susquehanna River receives many industrial and municipal discharges between Binghamton, New York and Owego, New York. Owego is only twelve river miles from the Pennsylvania border and the large number of discharges between Binghamton and Owego create the potential for cumulative downstream impacts.

The Chemung River presents a similar situation. The population centers of Corning and Elmira, New York are located on the Chemung River a short distance upstream from the Pennsylvania line. It is already known that discharges are occurring from Elmira which are causing water quality degradation in the Chemung River. Whether this degradation is carrying downstream into Pennsylvania has not been documented.

The Tioga River is degraded by acid mine drainage for most of its length. The Tioga-Hammond project at Tioga Junction, Pennsylvania has contributed to improved water quality downstream, but water quality in the vicinity of the New York line is still degraded.

Cayuta Creek is a very high quality stream for most of its length. However, pollution in the vicinity of Waverly, New York is a historical fact. The downstream reach of Cayuta Creek has been severely degraded with most of the impacted reach flowing through Pennsylvania. A new sewage treatment plant at Waverly appears to have improved water quality conditions in Cayuta Creek.

The lower Susquehanna River between Harrisburg, Pennsylvania and the Chesapeake Bay is a major production area for electricity. This section of river holds four hydroelectric dams, two nuclear power plants, one coal burning power plant and one pumped storage hydroelectric plant. These facilities all have impacts upon the Susquehanna River in varying ways. There is also increasing interest in the impacts of the Susquehanna River on the Chesapeake Bay, particularly with respect to water quality and water quality management.

Deer Creek has documented water quality problems in its headwaters near Stewartstown, Pennsylvania due to inadequate sewage treatment.

Two other streams which also have suspected water quality problems are Snake Creek and Seeley Creek. Both flow from Pennsylvania into New York.

In addition, this sampling program allows the investigation of smaller interstate streams. All of these flow between New York and Pennsylvania (see Table 4). Until now it has been assumed that these streams had good water quality due to the relatively undeveloped nature of their watersheds. Biological and chemical sampling will be conducted on these streams at a rate of one stream per month during warm weather in order to document water quality conditions.

D. Monitoring Parameters and Frequency of Collection. Sampling at these stations will include biological sampling of the macroinvertebrate community; conducting field tests for various physical and chemical parameters; and collecting water

samples which will be analyzed for chemical and bacteriological parameters.

In order to provide consistent data it is necessary to sample frequently. Past stream surveys have concentrated on summer base flow conditions. Comments from PaDER and MdDNR have suggested that year round sampling is necessary to provide data from high flow events and to differentiate seasonal trends. This may be especially critical with regards to the Chesapeake Bay. It is proposed to collect water quality samples on a monthly basis. Biological samples will be collected on a bimonthly basis as weather permits.

E. Parameter Table

Parameter	Number of Samples	Sample Matrix	Analytical Method Reference	Sample Preservation	Holding Time
Temperature	180	aq.		none	0
Dissolved oxygen	180	aq.		none	0

TOC	1.0	94-135% @ 1.2-6.0	+/- 0.36 @ 3.2

1. Accuracy was estimated from the recovery of pure material spiked into deionized water.

2. Precision was estimated from replicate analysis of the same sample, generally analyzed by the same analyst. Some samples were spiked deionized water.

3. N/A indicates that data is not available at this time.

Data representativeness. Water quality samples will be collected from riffle areas in the smaller streams. These areas have the greatest amount of mixing and therefore should be most representative of the stream. Composite samples will be collected from the larger streams and rivers to average out cross channel differences in water quality.

Data comparability. The purpose of this QA plan is to eliminate factors in sampling and analysis that will reduce the comparability of data collected at different points in space and time. All sampling, analysis and processing procedures are standardized to ensure comparability.

X. SAMPLING PROCEDURES

A. Macroinvertebrates: Macroinvertebrate sampling will be conducted in riffle areas of the streams. Qualitative sampling involves the use of a kick screen. The screen is stretched out perpendicular to the current, while the substrate upstream of the screen is raked up with a hoe so that macroinvertebrates are dislodged and carried into the net. Specimens are collected and the procedure is repeated until no new taxa are observed.

Quantitative sampling involves the use of a Surber sampler. This is a square metal frame attached to a net. The frame encloses one square foot of substrate. The sampler is placed onto the substrate in a shallow area with moderate current. The area inside the frame is agitated, dislodging macroinvertebrates which are swept into the net. The contents of the net are collected and preserved. A minimum of three Surber samples are collected at each station.

All collected specimens are preserved with 5% formalin solution. Identification of macroinvertebrate specimens to generic level be done by experienced SRBC staff using current taxonomic keys. Processing of macroinvertebrate data includes the calculation of average density values and diversity indices.

B. Field chemistry: Dissolved oxygen, conductivity and pH will be measured using meters. Meters will be checked for accuracy on a regular basis. Each instrument will have its own calibration log identified by W-number. Alkalinity and acidity will be measured using field titrations. Alkalinity will be measured in the field by titrating a known volume of sample water to pH 4.5 with 0.2N H_2SO_4 . Acidity will be measured in the field by titrating a known volume of sample water to pH 8.3 with 0.2N NaOH. Titrations will be done using automatic self-zeroing 10ml burettes.

C. Water samples

1. A total of 1120 ml of water will be collected for analysis and shipped to the Pennsylvania Department of Environmental Resources, Bureau of Laboratories in Harrisburg, Pennsylvania. The samples will consist of one 500 ml sample for general analyses, one 500 ml sample for metals analysis (this sample will be fixed with 5 ml of 1:1 HNO_3), and one 120 ml sample for bacteriological analyses. The two 500 ml bottles will be rinsed with sample water before being filled. The 120 ml bottles were autoclaved and inoculated with a fixative by the laboratory prior to the beginning of the stream survey.

D. Flow measurements: Most stations will be located at USGS gaging stations. At stations where flow measurements must be done, standard equipment and procedures followed by USGS will be used.

XI. SAMPLE CUSTODY PROCEDURES

Since the water samples collected will not be used for enforcement purposes, no sample custody procedures are performed.

XII. CALIBRATION PROCEDURES AND PREVENTATIVE MAINTENANCE.

A. Dissolved oxygen meter: The DO meter is a YSI model dissolved oxygen meter. Meter calibration will be done using the air-saturated chamber technique prior to and just after each day's use. This last calibration is always to be done and recorded in the calibration log. An additional calibration check will be conducted daily using the Winkler test. Calibration of the zero using Na_2SO_3 solution, and the temperature at three points will be done every three months.

Acceptable criteria

Winkler	$\pm 0.4 \text{ mg/l}$
Air saturated water	$\pm 0.3 \text{ mg/l}$
Zero	less than 0.2 mg/l
Temperature	$\pm 0.5^\circ\text{C}$

B. Specific Conductance meter: The conductivity meter is a Beckman Solu-bridge. Meter calibration should be recorded weekly against three specific conductance standards, obtained within six months.

Acceptable criteria

Standards (<1000 umhos/cm)	$\pm 4\%$
(>1000 umhos/cm)	$\pm 3\%$

C. pH meters: Record meter calibration against two buffers daily before and after use. This check is to always be done and recorded in the instrument calibration log.

D. Thermometers: Check thermometers on an as needed basis or at least semi-annually against laboratory grade thermometers.

Acceptable criteria

Temperature	$\pm 0.2^\circ$
-------------	-----------------

XIII. DOCUMENTATION AND DATA REDUCTION

A. Documentation - Water quality and biological samples collected in the field will be labeled at the time of collection. Water samples are collected in polypropylene bottles which are labeled with a seven digit identification number, a station code, and sampling date and time. The seven digit identification number consists of a four digit collector number and a three digit station number. The station codes are listed with the station descriptions in Table 1. This identification information is also recorded on a laboratory analysis form. One form is submitted with each set of samples and also includes an analysis code which designates the laboratory analyses to be conducted.

Upon receiving the results of laboratory analyses, the water quality data is transcribed to a computer data file. From here

data reductions can be performed directly, thus eliminating possibilities of transcription errors. Transfer to hardcopy data sheets is also done directly from these data files.

Biological samples are placed in glass bottles and labeled with the station code and date. These are then stored until field personnel return to the office and begin the identification process. During the identification process, the number of different taxa are recorded on log sheets. These log sheets are then transcribed onto a computer file. All data reduction and reporting of macroinvertebrate data is done from these computer data files to eliminate transcription errors.

Data from field tests are recorded in a field notebook (see Figure 1). This data is later transcribed to a computer data file for processing.

B. Data Reduction - The reduction of data (from raw analyses to specific results) involves different treatments of the data. Water quality data will be interpreted outright and also used to compute loadings. Macroinvertebrate and fish data will be used to compute diversity and other biotic indices. Data processing will be conducted using computer data files thus eliminating human transcription errors. Data entered into data files will be double checked to confirm accuracy. Statistical tests will be performed to correlate parametric data with other parametric data and other factors, and to analyze trends.

XIV. DATA VALIDATION

Primary responsibility for data validation lies with the collector. Field collections will be conducted according to

the above methodology to insure accurate data. The use of duplicates, reviewed by the project officer also validates the water quality analyses. The data will also be validated by testing ion balances and other mass balance comparisons against the data. The data also goes through a series of validations as they are entered into the STORET database.

Biological samples will be validated by the two staff biologists.

XV. PERFORMANCE AND SYSTEMS AUDITS

A. Laboratory analyses. Water samples will be labeled, chilled on ice, and shipped daily to the laboratory via Purolator. Analytical and quality assurance procedures for the laboratory are detailed in the QA plan submitted by the laboratory. Duplicate samples will also be submitted to the laboratory.

B. Field procedures. Field instruments and field operator techniques are checked twice a year for pH, alkalinity and specific conductance with USGS standard samples. The project officer is responsible for seeing that all field personnel are competent in assessment and collection techniques prior to the beginning of the stream survey. The project officer is also responsible for insuring the quality of all equipment and reagents. A percentage of duplicate tests will also be performed on alkalinity, acidity and turbidity as an additional quality control measure.

C. Biological sampling. A percentage of the biological samples will be reconstituted, resorted and identified

again by another staff biologist to verify the biological information.

X. CORRECTIVE ACTION

Problems that develop will be corrected as soon as possible. Since sampling will be on a monthly basis the implementation of corrective actions will ensure that problems do not go uncorrected and do not reoccur. The QA officer is responsible for reviewing all data and taking whatever actions are necessary to correct the problem.

XI. REPORTS

A draft project report will be written in January 1987 with a final report due by April 1, 1987. This report will list the data collected and the result of all treatments of the data. Conclusions will be drawn from the data and any recommendations based on the data will be made. In addition, the data will be utilized by SRBC staff as it becomes available for project review purposes. The data will also be entered into STORET within one month after it is received from the laboratory and validated.

APPENDIX D

DATA SET DOCUMENTATION
AND
DATA SET FILES

*TI: Assessment of Nutrient Sources from Main Stem and Selected
* Watersheds in the Susquehanna River Basin.

*DS: SRBC-STORM.A
*RR: SREC-STORM.B

*PI: Susquehanna River Basin Commission

*PO: 1721 N. Front St. Harrisburg PA 17102

*PR: Jerrald Hollowell, Chief Resource Management Quality
Protection Division, 717-238-0425

*PE: Oct. 1984 ongoing until Oct. 1989

*GE: Susquehanna River Basin

*GL:

*AB: Water quality monitoring activities consisting of
monthly baseflow and selected storm runoff sampling, field chemistry
measurements, sample preservation and shipment, and laboratory analyses.
Sample analysis based on "Techniques of Water-Resource Investigations
of the USGS, Book 5". Data is also contained in WATSTORE and STORET.
A remark code of " L " indicates the true value is less than the value
indicated. Remark codes follow the parameter value.

*GE: SUSQUEHANNA RIVER BASIN

*GL:

*AB: THE SUSQUEHANNA RIVER BASIN COMMISSION IN COOPERATION WITH THE USGS INITIATED A SURVEILLANCE SYSTEM TO MONITOR THE ABSENCE OR PRESENCE OF METALS AND CHEMICAL COMPOUNDS THAT ARE CONSIDERED TOXIC BY THE LATEST AVAILABLE INFORMATION. BECAUSE OF THE TENDANCY OF THESE SUBSTANCES TO BECOME ADSORBED ON THE SURFACE OF SUSPENDED SEDIMENT, ANNUAL SAMPLING OF STREAMBED SEDIMENT THROUGHOUT THE BASIN, DURING LOW FLOW, WOULD PROVIDE THE COMMISSION WITH AN INDICATION OF THE OCCURRENCE, TYPE AND MAGNITUDE OF TOXIC POLLUTANTS IN THE BASIN.

* SAMPLE COLLECTIONS WERE TAKEN DOWNSTREAM OF KNOWN DISCHARGE POINTS WHERE THE STREAMBED HAD AN ACCUMULATION OF ALLUVIAL MATERIAL.

 * MANAGEMENT PLAN. THE STUDY'S OBJECTIVE WAS TO: 1) ESTABLISH BASE-LINE
 * RECORD OF WATER QUALITY, 2) DETERMINE CHARACTERISTICS AND RATES OF
 * NATURAL PURIFICATION OF CODORUS CK. AND ITS TRIBUTARIES, 3) DETERMINE
 * PATTERNS OF POLLUTION DOWNSTREAM FROM WASTE DISCHARGE, 4) ESTIMATE
 * WASTE ASSIMILATION CAPACITIES, AND 5) ESTIMATE WASTE REDUCTIONS NECESSARY
 * TO MEET WATER QUALITY REQUIREMENTS.

*AB: SWATARA CREEK IS THE FARDEST DOWNSTREAM SUBBASIN THAT DRAINS ACID WATER FROM ANTHRACITE COAL MINES. SAMPLES WERE COLLECTED DURING HIGH AND LOW FLOWS AND ANALYZED FOR COMMON DISSOLVED PROPERTIES OF WATER. THE HYDROLOGIC PROCESSES OF DILUTION, CHANGES IN CHEMICAL COMPOSITION OF MINE OVERFLOW WATER, AND THE NEUTRALIZATION OF THE ACID SEGMENTS OF SWATARA CREEK WERE OBSERVED.

*PE: 1947-1970

*GE: PENNSYLVANIA, LOWER SUSQUEHANNA RIVER BASIN

*AB: A COMPILATION OF THE LOCATION, PERIOD OF RECORD, SAMPLING FREQUENCY AND
TYPE OF DATA SYNTHESIS FOR SUSPENDED SEDIMENT CARRIED BY PENNSYLVANIA
STREAMS. ALL SEDIMENT DATA LISTED WERE COLLECTED BY THE USGS MAINLY IN
COOPERATION WITH OTHER AGENCIES. THOSE STATIONS IN THE LOWER
SUSQUEHANNA RIVER BASIN ARE LISTED IN THE FOLLOWING SECTION. THOSE
STATIONS LISTED WITHOUT LATITUDES AND LONGITUDES WERE NOT LOCATED IN
STORET.

*AB: INVESTIGATIONS CONDUCTED BY THE DER IN RESPONSE TO VARIOUS WATER QUALITY SURVEYS RANGING FROM BACKGROUND DATA TO INDUSTRIAL WASTES IN STREAMS. REPORTS ARE TWO TO FIVE PAGES WITH INFORMATION ON WATER QUALITY PARAMETERS BEING FROM A ONE POINT IN TIME GRAB SAMPLE. WATER QUALITY PARAMETERS ARE STANDARD BIOLOGICAL, PHYSICAL AND/OR CHEMICAL DEPENDING ON TYPE OF INVESTIGATION. STREAM INVESTIGATED, COUNTY, DATE, AND INVESTIGATION TYPE FOR EACH REPORT IS AS FOLLOWS:
* BOWERS RUN, ADAMS, 4/14-15/74, BIGLERVILLE STP
* BOWERS RUN, ADAMS, 7/9/80, AWT/AST
* GARDER RUN, ADAMS, 10/22/80, GASOLINE SPILL
* OPOSSUM CREEK, ADAMS, 4/8/74, DUFFY-MOTTS
* OPOSSUM CREEK, ADAMS, 11/10/80, IW
* OPOSSUM CREEK, ADAMS, 7/3/79, PESTICIDE
* U.T. CONEWAGO CREEK, ADAMS, 6/20/72, IW-SEWAGE
* U.T. OPOSSUM CREEK, ADAMS, 11/5/75, ADAMS SANITATION CO
* U.T. BOB'S CREEK, BEDFORD, 9/29/83, PROPOSED STP
* CONESTOGA CREEK, BERKS, 10/2-11/2/72
* CONESTOGA CREEK, BERKS, 9/25/74, SEWAGE
* CONESTOGA RIVER, BERKS, 5/27/75, GRACE MINES
* SEASER BR JUNIATA RIVER, BLAIR, 7/19/84, SEWAGE
* BEAVER DAM BR JUNIATA, BLAIR, 7/15/71
* BLAIR GAP RUN, BLAIR, 10/16/79, SEWAGE
* FRANKSTOWN BR JUNIATA R, BLAIR, 8/19/82, IW
* FRANKSTOWN BR JUNIATA R, BLAIR, 2/24-25/83, IW
* FRANKSTOWN BR JUNIATA R, BLAIR, 10-19-83, IW
* HALTER CREEK, BLAIR, 9/16/82, SEWAGE
* LITTLE JUNIATA, BLAIR, 2/5/73, SEWAGE
* LITTLE JUNIATA & TRIBS, BLAIR, 7/19/79, BASELINE DATA
* LITTLE JUNIATA R, BLAIR, 7/20/83, BACKGRND-SEWAGE URBAN
* PLUM CREEK, BLAIR, 7/18/84, SEWAGE
* SANDY RUN, BLAIR, 7/17-18/75, HEAVY METALS
* SANDY RUN, BLAIR, 7/16/79, METALS
* BALD EAGLE, CENTRE, 6/23/71,
* LAUREL RUN, CENTRE, 6/23/71,
* LAUREL RUN, CENTRE, 12/5/72, SILTATION
* LAUREL RUN, CENTRE, 3/27/73, SILTATION
* PENNS CREEK, CENTRE, 8/9-11/72,
* PENNS CREEK, CENTRE, 5/20/82, GYPSY MOTH SPRAYING
* SINKING SPRING, CENTRE/11/15/71,
* SPRING CREEK, CENTRE, 6/7-8/71,
* BIG SPRING, CUMBERLAND, 11/19/71,
* BIG SPRING, CUMBERLAND, 1/25/73, DENODY STUDY
* BIG SPRING CREEK, CUMBERLAND, 4/2/71,
* BIG SPRING CREEK, CUMBERLAND, 4/30/71,
* BIG SPRING CREEK, CUMBERLAND, 10/16/79, SEWAGE
* BIG SPRINGS, CUMBERLAND, 2/2/72, FISH HATCH
* BIG SPRINGS, CUMBERLAND/3/16/72, FISH HATCH
* BIG SPRINGS CREEK, CUMBERLAND 1/10/74, FISH HATCHERY
* CONODOGUINET CREEK, CUMBERLAND, 7/31/79, LANDFILL
* GREEN SPRING, CUMBERLAND, 10/20/81, AGRICULTURAL
* GREEN SPRING, CUMBERLAND, 5/1/82, IW
* GREEN SPRING, CUMBERLAND, 7/21/82, IW
* HOLTZ CREEK, CUMBERLAND, 4/12/83, SEDIMENTATION
* HUNTERS RUN-MT. CREEK, CUMBERLAND, 1/5/72, PESTICIDES

EVANSTON, ILLINOIS 60201 OXFORD, OHIO 45056

*PE: 2 DAY INTERVAL IN JULY 1974

*GE: LOWER SUSQUEHANNA RIVER BASIN

*AB: THE CONCENTRATION AND ISOTOPIC COMPOSITION OF STRONTIUM IN WATER SAMPLES IN THE SUSQUEHANNA RIVER AND ITS MAJOR TRIBUTARIES BETWEEN NORTHUMBERLAND, PA AND THE CHESAPEAKE BAY HAVE BEEN DETERMINED TO INVESTIGATE THE USEFULNESS OF THE $^{87}\text{Sr}/^{86}\text{Sr}$ RATIO AS A TRACER IN HYDROLOGIC STUDIES. RATIOS ARE DETERMINED BY LOCAL BEDROCK TYPE AND AQUIFER CHARACTERISTICS. IN THE NORTHERN HALF OF THE STUDY AREA, THE RATIOS INDICATE INCOMPLETE MIXING OF TRIBUTARY AND MAIN STREAM WATERS. TRIBUTARIES WERE SAMPLED AT THEIR MOUTHS AND THE SUSQUEHANNA RIVER SAMPLED ABOVE AND BELOW THE POINT AT WHICH A TRIBUTARY ENTERS IT.

*STRONTIUM WATER CONCENTRATION WAS DETERMINED ON A PERKIN-ELMER MODEL 303 ATOMIC ABSORPTION SPECTROPHOTOMETER ACCORDING TO A METHOD OF FISHMAN AND DOWS, 1966 USGS WATER SUPPLY PAPER 1540-C, 23-45.

 * ANNAPOLIS, MD 21401 (301)224-2740
 *PR: JOHN J. AUSTIN, JR., CHEMIST
 *PE: JUNE 1977 TO JUNE 1978
 *GE: LOWER SUSQUEHANNA RIVER BASIN, HARRISBURG, PA., CITY ISLAND BRIDGE
 *AB: EPA MONITORED AMBIENT LEVELS OF ATRAINE (AATREX AND SIMAZINE (PRINCEP))
 FROM THE UPPER BAY, POTOMAC RIVER ESTUARY, AND THE SUSQUEHANNA RIVER AT
 HARRISBURG, PA. ALL SAMPLES AT HARRISBURG WERE DEPTH INTEGRATED
 COMPOSITES TAKEN BY THE USGS AT THE CITY ISLAND BRIDGE. SAMPLES WERE
 COLLECTED BOTH IN THE WEST AND EAST RIVER CHANNELS AROUND THE
 SAMPLES WERE RETURNED TO THE EPA, ANNAPOLIS FIELD OFFICE FOR ANALYSIS
 USING THE METHOD FOR TRAINE PESTICIDES IN INDUSTRIAL EFFLUENTS; FEDERAL
 REGISTER 38, NO. 75, PT. II.
 *
 * THIS WORK AND SUBSEQUENT STUDIES OF MARYLAND WATER SUPPLIES FOUND THAT
 TRAINE HERBICIDES ARE NOT REMOVED BY WATER TREATMENT PROCEDURES AND
 DISSIPATE IN THE ENVIRONMENT PRIMARILY BY DILUTION BOTH IN STREAMS AND
 IN THE SOIL COLUMN. THE MOVEMENT OF TRAINE THROUGH THE SOIL COLUMN HAS
 ALSO RESULTED IN GROUND WATER CONTAMINATIONS.

*AB: AS PART OF THE NATIONAL PESTICIDE MONITORING PROGRAM, THE U.S. FISH AND WILDLIFE SERVICE MEASURED ORGANOCHLORINE RESIDUES IN WHOLE FISH SAMPLES COLLECTED NATIONWIDE. RESIDUES OF DDT AND ITS HOMOLOGS AVERAGED SIGNIFICANTLY LOWER THAN THEY DID BEFORE 1975. DIELDRIN RESIDUES DECLINED SOMEWHAT NATIONALLY. PCB RESIDUES WERE MORE WIDELY DISTRIBUTED, BUT DECLINED IN AREAS OF HIGH CONCENTRATION. TOXAPHENE RESIDUES WERE VIRTUALLY UBIQUITOUS.

* THE SUSQUEHANNA RIVER STATION @ CONOWINGO DAM, MD IS ONE STATION OVER 100 STATIONS NATIONWIDE IN THE PROGRAM. THE STATION HAS BEEN OPERATING SINCE 1979. RESULTS OF THE ANNUAL DATA COLLECTIONS ARE AVAILABLE FROM THE STATE COLLEGE, PA FIELD OFFICE OF THE U.S. FISH AND WILDLIFE SERVICE. THE FISH SAMPLES WERE ANALYZED AT THE WISCONSIN ALUMNI RESEARCH FOUNDATION (WARF).

*AB: THE DATA PRESENTED SUMMARIZES THE ECOLOGICAL CONDITIONS IN THE CONOWINGO POND AND MUDDY RUN STORAGE POND. THE DATA SET CONTAINS INFORMATION ON WATER QUALITY AND THE DISTRIBUTION OF AQUATIC BIOTA. THE REPORTS ARE AVAILABLE SEMI-ANNUALLY AND THE METHODS UTILIZED ARE OUTLINED IN THE REPORTS. THE DATA INCLUDES A LIST OF 145,062 OBSERVATIONS WITH NINE VARIABLES FOR EACH OBSERVATION. THE DATA SET IS LISTED AS RECEIVED FROM RMC-MUDDY RUN ECOLOGICAL LABORATORY. THE DATA FILE CONSISTS OF THE FOLLOWING:

* COLUMNS: VARIABLE:
* 1-4 STATION
* 5-12 DATE
* 13-17 TIME
* 18-19 NUMERIC PARAMETER CODE
* 20-44 PARAMETER NAME
* 45-47 DEPTH OF SAMPLE
* 48-49 SAMPLE REPLICATE NUMBER
* 50-57 UNITS
* 58-64 MEASURED VALUE

*PA: THE PARAMETERS COLLECTED INCLUDE THE FOLLOWING:

WATER TEMPERATURE	DISSOLVED OXYGEN	PH
CONDUCTIVITY	BICARBONATE	CARBONATE
SODIUM	POTASSIUM	CALCIUM
MAGNESIUM	CHLORIDES	SULFATE
NITRATE	NITRITE	DISSOLVED IRON
REACTIVE SILICA	PHOSPHATE	SESTON
SECCHI	CHLOROPHYLL-B	CHLOROPHYLL-C
TOTAL CHLOROPHYLL-A	REACTIVE CHLOROPHYLL-A	FLOW

*GL:
*AB: THE WATER QUALITY OF THE SWATARA CREEK WAS STUDIED FROM JULY 1981
* THROUGH SEPTEMBER 1984 TO DETERMINE THE IMPACT OF COAL MINNING ACTIVITIES
* ON THE WATER QUALITY OF A PLANNED 10,500 ACRE-FOOT RESERVOIR. THE
* PROJECT WAS DESIGNED TO (A) MEASURE SURFACE WATER INFLOWS AND OUTFLOW IN
* THE PROPOSED IMPOUNDMENT AREA, AND MEASURE THE CONCENTRATION OF
* SUSPENDED SEDIMENT, NUTRIENTS, AND CONSTITUENTS COMMON TO ACID MINE
* DRAINAGE IN THESE FLOWS, (B) DETERMINE THE DISCHARGE OF THE ABOVE
* CONSTITUENTS TO THE PLANNED RESERVOIR DURING A YEAR OF AVERAGE STREAMFLOW,
* (C) DETERMINE THE NUTRIENT AND METAL CONCENTRATIONS IN BOTTOM MATERIAL
* IN THE VICINITY OF THE IMPOUNDMENT, AND (D) ESTIMATE THE FUTURE WATER
* QUALITY IN AND DOWNSTREAM FROM THE PLANNED RESERVOIR. THE THREE STATIONS
* LISTED BELOW ARE ALL SPECIFIC TO THE PROJECT.
*ST: STATION,LAT.,LNG.,RIVER MILE,DESCRIPTION
* 01571919,403243,762251,?,SWATARA CK ABOVE RTE 995 @ PINE GROVE
* 01572000,403215,762240,?,LOWER LITTLE SWATARA CK @ PINE GROVE
* 01572200,403338,763126,?,SWATARA CK @ INWOOD
*PA: OVER 90 PARAMETERS COLLECTED INCLUDES PHYSICAL DATA, SEDIMENT DATA,
* METALS DATA, AND BOTTOM MATERIAL CHEMIGTRY AND PARTICLE SIZE DISTRIBUTION

CBP.REPORT41

*TI: WATER QUALITY MONITORING NETWORK OF INTERSTATE STREAMS IN THE
* SUSQUEHANNA RIVER BASIN.
*CS: IN STORET AGENCY CODE - 42SRBCWQ
*RR: NONE
*PI: SUSQUEHANNA RIVER BASIN COMMISSION
*PO: 1721 NORTH FRONT STREET
* HARRISBURG, PA 17102
* (717) 239-0423
*PR: CARL P. MCMORRAN
*PE: APRIL 1968 - PRESENT
*GE: LOWER SUSQUEHANNA RIVER BASIN, PA-MD BORDER
*AE: THE WATER QUALITY MONITORING NETWORK CONSISTS OF A SERIES OF SURFACE WATER
* QUALITY STATIONS WHICH ARE PERIODICALLY SAMPLED FOR BIOLOGICAL AND WATER
* QUALITY CONDITIONS. THE DATA IS REVIEWED TO DETERMINE IF INTERSTATE WATER
* QUALITY STANDARDS ARE BEING COMPROMISED. THIS SAMPLING PROGRAM ALLOWS
* THE INVESTIGATION OF SMALLER INTERSTATE STREAMS ASSUMED TO HAVE GOOD WATER
* QUALITY. THIS MONITORING NETWORK ENHANCES THE ABILITY FOR SRBC STAFF TO
* REVIEW PROJECTS THAT MAY RESULT IN A SIGNIFICANT INTERSTATE EFFECT ON THE
* WATER RESOURCES IN THE BASIN.
*ST: STATION,LAT.,LONG.,RIVER MILE,DESCRIPTION
* EEAU1.5,?,?,1.5,EEAUGH'S CREEK NEAR STEWARTSTOWN PA.
* DEER44.2,?,?,44.2,DEER CREEK NEAR STEWARTSTOWN PA.
* SUSQ44.5,?,?,44.5,SUSQUEHANNA RIVER @ MARIETTA PA.
* OCTOB8.6,?,?,8.6,OCTORARO CREEK NEAR CAMP HORSESHOE PA.
* CNWG4.4,?,?,4.4,CONWINGO CREEK NEAR PLEASANT GROVE PA.
* SUSQ3.0,?,?,3.0,SUSQUEHANNA RIVER NEAR HARVE DE GRACE MD.
*PA: PARAMETER,UNITS,CAS CODE, LABEL
* WTEMP,DEG C,NONE,WATER TEMPERATURE
* DO,MG/L,7732447,DISSOLVED OXYGEN
* SCOND,UCMHS,NONE,SPECIFIC CONDUCTIVITY
* PH,S.U.,NONE,PH
* ALK,MG/L,NONE,ALKALINITY
* ACID,MG/L,NONE,ACIDITY AS CACO3
* TURBID,S.U.,NONE,TURBIDITY
* BOD5,MG/L,NONE,BIOCHEMICAL OXYGEN DEMAND 5-DAY
* DSOLIDS,MG/L,NONE,DISSOLVED SOLIDS
* TAMMONIA,MG/L,17773880,TOTAL AMMONIA
* TN02,MG/L,17773880,TOTAL NITRITE
* TN03,MG/L,17773880,TOTAL NITRATE
* TP04,MG/L,14255443,TOTAL PHOSPHATE
* TCA,MG/L,7440702,TOTAL CALCIUM
* TMG,MG/L,7439954,TOTAL MAGNESIUM
* TCOL,MG/L,16887006,TOTAL CHLORIDES
* TS04,MG/L,14206798,TOTAL SULFATE
* TFE,MG/L,74399296,TOTAL IRON
* TMN,MG/L,7439956,TOTAL MANGANESE
* TAL,MG/L,7429905,TOTAL ALUMINUM
* FECCOL,COL/100ML,?,FECAL COLIFORM
* FECSTR,COL/100ML,?,FECAL STREP
